

Air Helper Springs for Vans

The Air Helper Spring system is installed in the service van rear suspension, providing load support when the van is hauling heavy loads. The system allows that the original suspension height is maintained, this providing damage protection, better stability and braking, and ride comfort.

The wireless remote control can be used for manual or automatic height adjustments, and can adjust each side independently.

The installation is made without removing or altering the original suspension components.

Installed air helper spring

System installed on a MB Sprinter Van

Wireless remote control
